Solvents for Fuel Additives

Why is the role of solvents essential?

C10 aromatics are used as solvents to stabilise and solubilise fuel additive formulations as a carrier fluid. Using solvents in this application is essential because they dissolve and stabilise the solids in the fuel additives.

This ensures that active ingredients like defoamers, demulsifiers, corrosion inhibitors, octane/cetane improvers, and extreme pressure additives are effectively integrated into the fuel. Without solvents, the solids might not dissolve completely, leading to inadequate dosing and reduced effectiveness of the additives, resulting in lower engine performance.
